

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

Read more about Early Journal Content at <http://about.jstor.org/participate-jstor/individuals/early-journal-content>.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

MEMOIRS
OF THE
AMERICAN ACADEMY
OF
ARTS AND SCIENCES.

—
VOL. III.—PART I.
—

—*—
CAMBRIDGE,
PRINTED BY HILLIARD AND METCALF.
1809.

ADVERTISEMENT.

AT the time of presenting to the Public this first part of the third volume, it may not be improper to observe, that the Academy refer the business of publishing their Memoirs to a Committee, which for some years past has been chosen annually for this purpose ;—that the Academy have declared in their Statutes, and notice of it has been given in their preceding volumes, that they “ will never give their judgment or opinion upon any literary performance presented to them, but allow it to rest upon its own merit, and the credit of its author ;”—that the Committee, while exercising their discretionary power within proper limits in making a selection from papers on the files of the Academy and printing the same, do not subject themselves to any part of that responsibility for a paper, which the Academy has so properly permitted to rest on the author ;—that the publication of a paper may be expedient on the ground of the utility, importance, or singularity of the subject, or the advantageous manner of treating it, without involving or justifying the inference, that the Committee believe every fact, related, to be true, every step in the reasoning accurate, every conclusion just, or every hypothesis probable.

CONTENTS.

	PAGE.
I. <i>Observations of the comet of 1807, by Nathaniel Bowditch, A.M.</i> F.A.A.	1
II. <i>Observations on the total eclipse of the sun, June 16, 1806, made at Salem, by Nathaniel Bowditch, A.M.</i> F.A.A.	18
III. <i>Addition to the memoir on the solar eclipse of June 16, 1806, by Nathaniel Bowditch, A.M.</i> F.A.A.	23
IV. <i>Application of Napier's rule for solving the cases of right-angled spheric trigonometry to several cases of oblique-angled spheric trigonometry, by Nathaniel Bowditch, A.M.</i> F.A.A.	33
V. <i>Two tables of the varieties in the first and second cases of oblique spherics, inclosed in a letter to the Hon. John Davis, Esq. Recording Secretary of the American Academy of Arts and Sciences, by William Crosswell, A.M.</i>	38
VI. <i>Remarks on the construction of the common scale-beam, with a description of the new gold standard beam, invented by the author, Benjamin Dearborn, F.A.A.</i>	40
VII. <i>A proposal for adjusting a new scale to the mercurial thermometer, inclosed in a letter to the late Rev. President Willard, dated August 1789, by Edward A. Holyoke, M.D.</i> F.A.A.	51
VIII. <i>An account of the springs and wells on the peninsula of Boston, with an attempt to explain the manner, in which they are supplied; in a letter to the Hon. John Davis, Esq. Recording secretary of the American Academy of Arts and Sciences; by John Lathrop, D.D.</i> F.A.A.	57

- IX. *On the origin and formation of ice islands and their dangerous effects in navigation ; pointing out a certain and easy method of timely fore-warning seamen of their approach, even in the darkest night ; by A. Fothergill, M.D. F.R.S. A.P.S. &c.* 69
- X. *Effects of lightning on several persons in the house of Samuel Cary, Esq. of Chelsea, August 2, 1799 ; in a letter to the Hon. John Davis, Esq. Recording Secretary of the American Academy of Arts and Sciences ; by John Lathrop, D.D. F.A.A.* 82
- XI. *Effects of lightning on the house of Capt. Daniel Merry, and several other houses in the vicinity, on the evening of the 11th of May 1805 ; in a letter to the Hon. John Davis, Esq. Recording Secretary of the American Academy of Arts and Sciences ; by John Lathrop, D.D. F.A.A.* 86
- XII. *Effects of lightning on the house of the Rev. Silas Moody of Arundel in Maine, August 17, 1807 ; in a letter to the Rev. Dr. Eliot ; by the Rev. Silas Moody A.M.* 92
- XIII. *Effects of lightning on the house of Capt. Thomas Manning in Portsmouth, New Hampshire ; in a letter to the Rev. Dr. Eliot ; by the Rev. Timothy Alden, jun. A.M. S.H.S.* 93
- XIV. *Experiments respecting dew, intended to ascertain whether dew is the descent of vapour during the night, or the perspiration of the earth, or of plants ; or whether it is not the effect of condensation ; by Noah Webster, Esq. F.A.A.* 95
- XV. *Account of rain, &c. that fell in Charlestown, Massachusetts in ten years ; by Joseph Barrell, Esq.* 104
- XVI. *Account of meteorological observations, made in Georgia and South Carolina ; by Abiel Holmes, D.D. F.A.A.* 107
- XVII. *Meteorological observations at Grove Plantation, five miles south of Natchez ; by Winthrop Sargent, Esq.* 113
- XVIII. *Abstract of meteorological observations, made at Michillimackinac,*

	PAGE.
<i>in the latitude of about 46° N, and longitude of about 84° 30' W ; from August 1802 to April 1803, both inclusive ; by Josiah Dun- ham, Esq.</i>	116
XIX. <i>Meteorological observations, made at Bowdoin College ; in a letter to Mr. Levi Hedge, F. A. A. Tutor in Harvard College ; by Parker Cleveland, A.M. Professor of Mathematics and Natural Philosophy.</i>	119
XX. <i>The quantity of water (including the snow reduced to water), which fell in Stow from 1792 to 1804 ; according to the observations of the Rev. Jonathan Newell, A.M.</i>	122
XXI. <i>A curious phenomenon of vision ; in a letter to . . . by the Rev. Peres Fobes, LL.D. F.A.A.</i>	123
XXII. <i>Hard water softened by farinaceous soap, with the process for making the same ; by the Rev. Daniel Little, F.A.A.</i>	125
XXIII. <i>Mineralogical observations, made in the environs of Boston in the years 1807 and 1808 ; inclosed in a letter to the Hon. John Davis Esq. and by him communicated ; by S. Godon, F.A.A.</i>	127
XXIV. <i>Account of fossil shells, with the author's reasons for attending to the same ; in a letter to Levi Hedge, F.A.A. by Parker Cleveland, A.M. Professor of Mathematics and Natural Philosophy in Bowdoin College</i>	155
XXV. <i>Account of pawpaw or cowry shells, found in Dorchester ; by Thad- deus Mason Harris, A.M. F.A.A.</i>	159
XXVI. <i>Observations on a singular natural production, in which one part ap- pears to be a plant and the other an insect, accompanied with a speci- men ; by the Rev. Manasseh Cutler, LL.D. F.A.A.</i>	161
XXVII. <i>Account of the writing or Dighton rock ; in a letter to the Hon. John Davis, Esq. Recording Secretary of the American Academy of Arts and Sciences ; by Mr. E. A. Kendal</i>	165

	PAGE.
XXVIII. <i>Account of a stone bust, supposed to be an Indian god ; by Ezra Stiles D.D. LL.D. late President of Yale College</i>	192
XXIX. <i>Account of copper coins, found in Medford, Massachusetts ; in a letter to the Hon. John Quincy Adams, Esq. Corresponding Secretary of the American Academy of Arts and Sciences ; by the Rev. Thaddeus Mason Harris, A.M. F.A.A.</i>	195
XXX. <i>An attempt to explain the Inscription on Dighton rock ; in a letter to the Rev. Samuel Webber, D.D. by the Hon. John Davis, Esq. LL.D. F. A. A.</i>	197
XXXI. <i>Animadversions on the dangerous practice of sleeping on the damp ground, and of exposure to the night air, particularly where the animal powers are diminished, illustrated on philosophical principles ; inclosed with a letter to Aaron Dexter, M.D. F.A.A. and William Spooner, M.D. F.A.A. by A. Fothergill, M.D. F.R.S. &c.</i>	206

TABULAR VIEW

OF THE SUBSTANCES, WHICH CONSTITUTE THE MINERAL SOIL OF THE EN

Simple minerals.

Acidiferous substances.

- Carbonated lime.*
- A *Lamellar* (calcareous spar), forming veins in wacke (34), kernels or globules in amygdaloid (38), in amphiboloid (9).
- B *Compact* (Lime stone), in thin veins in argilloid (30).
- N. B. Some salts diluted in spring water (3) excepted, carbonated lime is the only acidiferous substance I have observed in the environs of Boston, where it appears existing but in a very slight quantity.

Earthy substances.

- Quartz.*
- A *Hyaline* (rock crystal), often found with crystalline shape (var. prismoid) in the cavities of some blocks scattered on the surface of the soil.
- B *Compact*, most often *opaque* (hornstein of Werner) very diversified in its colours. The variety A is found sometimes mixed with chlorite talc, and also with epidote. In this last case it constitutes the *praser* of Germ. (Brighton, Menotomy). Quartz is one of the elements of several rocks, and is found frequently disposed in veins running across them.

Felspar.

One of the predominant elements of the rocks, which constitute the frame of the country, commonly with a lamellar texture, with a great diversity of colours; found with crystalline shape (var. ditetradral) accompanied with epidote and asbestos. (Brighton).

Amphibole. (Hornblende Wer.)

One of the most diffused elements of the rocks of Massachusetts; commonly with a lamellated texture, and a dark blue or black colour. (4 to 19).

- Epidote* (Glassy actinolite Kirw. Glasartiger Hahlstein Wer.)
- A *Crystallised*, sometimes in six sided prisms deprived of summits (the diameter of the prisms about 4 or 5 lines, Brighton) or in four sided rhomboidal prisms, the measure of the angle of which agrees with the primitive form of this substance. (Swt. Elements of Hätty) or in small striated longitudinally needles, imbedded in carbonated lime (Brookline), but more frequently
- B *Compact*, disposed in veins, running across several rocks, (9, 16—21) or forming one of their elements (9—16). Its common colour is green of several shades.

Mica.

One of the elements of some varieties of rocks, as felsparoid, amphiboloid (11, 17), but commonly in small proportion. Its common colour is whitish, smoaky, yellow of brass.

- Asbestos.*
- A *Flexible* (vulg. amiant) with a yellowish white colour. It accompanies epidote and crystallised felspar (Brighton ○). Its gang is argilloid or epidotic amphiboloid.
- B *Stiff* (Actinolite Kirw.), with a greenish colour. The gang is argilloid (Newton ⊞).

Earthy substances.

- Talc.*
- A Laminary, in small hexaedral lamina, of a bright green colour (12).
- B Chlorite (chlorit erde Germ.). It accompanies carbonated lime, laminary, and quartz. (Brighton) (38). This last variety, which appears abounding in some places, may afford a solid green colour for painting. (An essay of this colour is sent to the Academy).

Garnet.

Commonly in small trapezoidal crystals in some loose fragments of felsparoid.

Tourmaline.

Found, scarcely, in some loose pieces of felsparoid (Dorchester), sometimes with the form belonging to the variety isogone.

Emerald.

Some loose fragments of felsparoid give some signs of this substance.

N. B. These three minerals, found in great plenty in other parts of North America, may be considered here, as exceptions.

Combustible sub.

Peat.

Found in great plenty in several parts of the environs of Boston, principally in places where stagnant waters in contact with aquatic vegetables favour their decomposition, so soon as they are deprived of their vegetative faculty.

No signs of other combustibles found yet in the compass of twelve or fifteen miles from Boston.

Metallic substances.

- Copper.*
- Pyritous* (Kupferkies of Germ.). Its matrix is quartz, which accompanies amygdaloid (38) generally in small particles, but some signs more worthy of attention found in the north west direction.
 - Carbonated green* (vulg. malachite) in light spots, which accompanies the preceding var. sometimes disseminated in the whole mass of amygdaloid (38), or coating some faces of its fragments.

- Iron.*
- Oligist.* (Specular iron ore Kirw.). In small lamina in some fragments of quartz (27, 38).
 - Oxyduled.* (Magnetic iron ore Kirw.) (17).
 - Arsenical* (Mispikel of many miner.), sometimes prismatic, common matrix argilloid, or petrosilex (24).
 - Sulphurated* (common pyrites), often crystallised in cubes, gang, commonly argilloid or petrosilex (24).
- A Sulphurated magnetic (vulg. magnetic pyrites), embodied commonly in amphiboloid (4).
- Carbonated.* (Brown spath of Germ.), found but rarely in small lenticular or rhomboidal crystals (27, 35).

Manganese.

Oxyded black and brown, forming mamellary concretions on the surface of some rocks, as petrosilex argilloid (24), or in superficial dendrites. Manganese appears the chief colouring body of most of the minerals and rocks of this part of America.

Primordial soil.

Alluvial deposits.
